Since the events of September 11 and Hurricane Katrina, much attention has been placed on preparing “first responders” for disasters. The design team’s master plan envisions a state-of-the-art training environment for medical personnel from around the country to prepare for real-world disaster and emergency scenarios. In addition to establishing a cohesive and unique campus structure, the plan also includes specific training environments related to transportation mishaps, explosions and building collapses, as well as a training center, support facilities and a comprehensive green energy and infrastructure network.

DESIGN NOT CONSTRUCTED

In addition to establishing a cohesive and unique campus structure, the plan also includes specific training environments related to transportation mishaps, explosions and building collapses, as well as a training center, support facilities and a comprehensive green energy and infrastructure network.

This aerial model image provides an overall view of the proposed plan. A large, heavily planted parking lot with biofiltration swales is divided from the working portion of the site by an existing mound that separates public and secure realms.
